

## Grease filter user manual

---

The grease filter works by trapping the grease particles and keeping them suspended.

By periodically replacing it you can ensure that the hood filtering system remains in top condition, thus assuring that the product functions properly and has a long life.

The grease filter must be washed by hand or in the dishwasher at (65°C) with suitable detergents (rapid cycle). Wash at least once per month, and in any case, as needed.

When washed in the dishwasher, the grease filter may fade; this does not in any way affect its filtering characteristics.
